

Image Processing Techniques and its Applications in Computer Vision and Artificial Intelligence

Chapter	Title	Page No.
1	Foundations of Image Processing Understanding Pixels Color Models and Image Formats	12
2	Image Acquisition and Preprocessing Techniques for Noise Reduction and Enhancement in Digital Images	43
3	Advanced Feature Extraction Techniques Using Local Binary Patterns Histogram of Oriented Gradients and SIFT	68
4	Morphological Image Processing Techniques for Shape Analysis Object Recognition and Image Reconstruction	91
5	Comparative Analysis of Image Segmentation Methods From Thresholding and Clustering to Convolutional Neural Networks	116
6	Color Image Processing Techniques for Effective Color Enhancement Color Space Conversion and Color Constancy	143
7	Texture Analysis Techniques Using Statistical Measures Structural Approaches and Machine Learning Methods	167
8	Advanced Image Filtering Techniques for Smoothing Sharpening and Edge Detection in Various Applications	192
9	Deep Learning Architectures for Image Processing Including Convolutional Neural Networks and Generative Adversarial Networks	215
10	Object Detection and Recognition Techniques Utilizing Deep Learning Frameworks for Real-Time Applications	244
11	Image Classification Techniques Leveraging Support Vector Machines Decision Trees and Neural Networks	270
12	Image Registration Techniques for Multi-Modal Imaging Including Feature-Based and Intensity-Based Methods	300
13	Augmented Reality Techniques for Image Processing in Interactive Systems and Gaming Applications	323
14	Image Processing Techniques for Autonomous Vehicles Including Lane Detection and Obstacle Avoidance	349
15	Video Processing Techniques for Motion Detection Object Tracking and Real-Time Analysis in Surveillance	375
